SCOPING DOCUMENTS

(1st round of prioritization)

Prioritized substance group: Emerging chemicals

Chemical Group leader: Greet Schoeters

Date: 26 March 2018

Document version: 2.0

1. Prioritised substance group: Emerging Chemicals

Responsible author:	Greet Schoeters
Short name of institution:	VITO
Co-authors:	J-P Antignac, G. Koppen, J. Bessems, L. Debrauwer, A. Covaci

1.1 Background Information

Emerging Chemicals (ECs) should be understood as chemicals of emerging concern, which can reach human tissues via direct usage of consumer products or uptake via the environment and food. Most of them are manufactured or manmade and their toxicity or persistence are likely to significantly alter the metabolism of a living being (Sauvé and Desrosiers, 2014). Those substances are not yet included in existing HBM programs, partially due to the absence of analytical method available to determine the considered chemical or its metabolites in human specimen. In any case there is a lack of knowledge about the burden of the general population with these so-called emerging substances.

Chemicals can be considered as emerging substances when: (i) they are really '**new substances**' (e.g. recently developed substitutes for substances currently under regulation or which have been banned) or (ii) substances possibly already present for a while in the environment-food-human continuum, but '**causing a new concern**'. Such new concerns can arise due to sensitivity improvements of analytical methods, allowing the detection at low concentrations of formerly not detected substances in the environment or human. In addition, new application fields developed by the chemical industry for a known chemical can open up a new route of exposure. Alongside, recent toxicological facts including increasing presence in the environment and effects on environmental species can be an alert and can also change the perspective for human risk assessment on a given chemical.

In interaction with the prioritization process established within WP4, a complementary list of emerging chemicals candidates is being generated in the first year by WP16. This inventory is based on existing lists of emerging chemicals. ECHA screens systematically available information for substances in the REACH registration dossiers to identify substances of potential concern or substances of very high concern. The NORMAN network lists the currently most frequently discussed emerging substances and emerging pollutants in the field of environment, the EMPODAT: is a database of geo-referenced monitoring / occurrence data on emerging substances, the NORMAN MassBank: is a database of mass spectra of unknown or provisionally identified substances, the NORMAN Suspect List Exchange: a central website to access various lists of substances for suspect screening. But also bottom-up suggestions originated from WP16 partners daily involved in the characterization of the Human chemical exposome in various contexts will be included. This inventory will be shared and crossed with the WP4 related activity, and further prioritization will occur by considering available exposure, toxicological, and metabolism data as well as analytical considerations. Besides this *a priori* inventory based approach, the development and application of untargeted approaches will be operated within WP16 in the scope of revealing, then identifying,

new (i.e. not yet known) markers of exposure related to chemicals of concern for HBM (parent compound or metabolite).

Globally, work on emerging chemicals within the HBM4EU project aims at providing anticipation and early warning, and generating exploratory human data for guiding next orientations of HBM in terms of relevant targets. Concretely the outputs of this dedicated chemical group and associated WP16 are expected to contribute mainly to the third and last round of prioritization. This is also referring to a reactivity process and ambition to minimize the delay before warning and real measurement at HBM scale. It is globally based on a principle of reality-driven approach, and a bottom-up characterization of current human exposome as observed to help prioritization of further investments and methodological effort targeted toward certain biomarkers of exposure rather than others. Now all this proposed work in relation with emerging substances still remains a front-of-science associated to a significant level of necessary innovation and methodological research besides these clearly finalized objectives.

1.2 Categorization of Substances

Emerging chemicals may fall in two categories.

The first one is related to a priori already identified substances. The second one is related to not yet known/identified substances. For the first category, the prioritization process and related criteria established within WP4 will be used as a basis for dispatching the different compound candidates between Cat. C and Cat. D. In particular, main criteria considered for this categorization will rely on (i) the investment needed in term of method development and (ii) the knowledge gap in term of exposure data. Indeed, the total number of substances finally classified into Cat. C after application of the systematic process developed within WP4 is expected to be very high. One part of these substances will be handled in WP9 with regard to the development and/or adaptation of appropriate quantitative methods. But realistically this will not be the case for the whole set of compound candidates. For some of these substances (constituting the Cat. D group), the development and application of a semi-quantitative suspect screening approach is then proposed in WP16, with the objective to generate a first level of data enabling to document the reality of human exposure and better justify further investment in a full quantitative and validated method development.

For the second category (constituting the Cat. E group), non-targeted screening approaches coupled to identification of unknowns capabilities and competences will be developed and applied in order to reveal, and further identify, new (i.e. not yet known) markers of exposure related to chemicals of concern for HBM (parent compound or metabolite). From a methodological point of view, this main component of the WP16 work plan will be based on the last generation of mass spectrometric technologies, that offer a unique and never achieved perspective for such global and untargeted sample characterization. High resolution mass spectrometry, already in place in several labs in EU, will be the main support of these investigations, coupled to hyphenated competences in terms of data processing and analysis for extracting the relevant information from the generated global chemical profiles.

Table 1: Substances included in the substance group, listed according to availability of toxicology and human biomarker data.

Cat.	Abbrev./ Acronym	Systematic name	Regulation
A	-	-	-
B	-	-	-
C	-	-	-
D	<i>a priori</i> already identified compounds but not yet measured in humans to be measured by suspect target screening	<u>To be defined as a result of the first year prioritization process</u>	-
E	substances measured by non-target screening and (1) described in chemical databases or (2) not yet described (unknowns)	-	-

1.3 Objectives / Policy-related questions

1. Providing early warning of presence of unknown and emerging concern chemicals in EU population
2. Inform REACH process to identify substances of very high concern
3. Inform development of strategy for a non-toxic environment (7th Environment Action Programme)

1.4 Research activities to be undertaken

Table 2: Listing of research activities to be carried out to answer the policy questions

Substance	Policy question	Available knowledge related to policy question	Knowledge gaps / Activities needed to answer policy question
D	Early warning of presence in EU population	Different inventories of emerging chemicals exist internationally in the field of environment, food safety, registration of chemicals for the REACH process, occupational exposures	<p>Inventarise existing lists or databases related to emerging chemicals at international level to get a good overview (WP16 Y1)</p> <p>Check whether it is analytically feasible to monitor substances on these lists in human samples.</p> <ul style="list-style-type: none"> ➤ Develop prioritisation tool for analysis of these chemicals based on kinetics and toxicological properties, production volume and policy/societal concerns (WP4). ➤ Improve screening methods to allow detection of emerging chemicals (WP16) including effect directed screening assays (WP14), improve and apply these methods for different human matrices (urine, blood, placenta, maternal milk, adipose tissue, meconium, hair...) including sample preparation, information extraction, data processing and provide guidelines for method validation. ➤ Select biobanked samples for screening. ➤ Screen human matrices for the presence of emerging chemicals. Collate existing data on mammalian metabolism/distribution/excretion of the selected Cat. D emerging chemicals. If not available: predict potential metabolites using computer models/software and existing data as input for the screening above (WP12).

Substance	Policy question	Available knowledge related to policy question	Knowledge gaps / Activities needed to answer policy question
	Inform REACH process to identify substances of potential concern	REACH uses IT screening tools to get information of potential concern	Provide information on biological half-life in human matrices and if possible also linkage to effect and health outcomes (WP12).
	Development of strategy for a non-toxic environment -> first step		<ul style="list-style-type: none"> ➤ Develop an indicator to monitor in humans the bioaccumulation of the above identified chemicals of potential concern. ➤ Develop an indicator to monitor in humans the decrease of total chemical load of environmental chemicals (WP5).

E			<p>WP16</p> <ul style="list-style-type: none"> ➤ Improve non target screening methods to detect not yet identified emerging chemicals in human matrices including sample preparation, information extraction, data processing and provide guidelines for method validation. ➤ Select biobanked samples for first screening steps. ➤ Screen human matrices (urine, blood, placenta, hair, maternal milk, adipose tissue, meconium...) for the presence of unknowns. ➤ Generate databases for identification of the unknowns in human samples, based on mass spectral information
